What is claimed is:

1. A non-volatile synchronous memory device comprising:

an array of non-volatile memory cells arranged in a plurality of addressable banks, each bank comprises addressable rows and columns of non-volatile memory cells; and

a plurality of bank buffers coupled to each of the plurality of addressable banks, wherein each of the plurality of bank buffers comprises bits to store data from a row of memory cells contained in a corresponding bank of the plurality of addressable banks.

2. The non-volatile synchronous memory device of claim 1 wherein the plurality of addressable banks comprise four addressable banks.

3. The non-volatile synchronous memory device of claim 1 further comprising control circuitry to copy data from a first row of a first bank of the plurality of addressable banks to a first buffer of the plurality of buffers.

4. The non-volatile synchronous memory device of claim 3 wherein an address of the first row is predefined and the control circuitry copies the data in response to an externally provided command.

5. The non-volatile synchronous memory device of claim 1 wherein the plurality of buffers can be read while data is written to the plurality of banks.

6. A processing system comprising:

a processor; and

a non-volatile synchronous memory device coupled to the processor and comprising:

an array of non-volatile memory cells arranged in a plurality of addressable banks, each bank comprises addressable rows and columns of non-volatile memory cells, and

a plurality of bank buffers coupled to each of the plurality of addressable banks, wherein each of the plurality of bank buffers comprises bits to store data from a row of memory cells contained in a corresponding bank of the plurality of addressable banks

Sub A 1

7. The processing system of claim 6 wherein the plurality of addressable banks comprise four addressable banks.

8. The processing system of claim 6 wherein the non-volatile synchronous memory device further comprises control circuitry to copy data from a first row of a first bank of the plurality of addressable banks to a first buffer of the plurality of buffers.

9. The processing system of claim 8 wherein an address of the first row is predefined and the control circuitry copies the data in response to an externally provided command.

10. The processing system of claim 6 wherein the plurality of buffers can be read while data is written to the plurality of banks.

11. A method of writing to a flash memory comprising:

copying first data stored in a row of a non-volatile memory cell array bank to a buffer circuit;

performing a write operation to write second data to the array bank; and

reading the first data from buffer circuit while performing the write operation.

12. The method of claim 11 further comprising:

monitoring a status of the flash memory to determine when the write operation is completed.

13. The method of claim 12 wherein monitoring is performed by an external processor in response to the first data read from the buffer circuit.

14. The method of claim 11 wherein copying the first data is initiated by an external processor coupled to the flash memory.

15. The method of claim 11 wherein copying the first data and performing the write operation is initiated by an external processor coupled to the flash memory.

16. A method of operating a flash memory comprising:

copying first data stored in a row of a first array bank to a buffer circuit;

performing a write operation to write second data to the first array bank in response to an external processor coupled to the flash memory;

reading the first data from buffer circuit while performing the write operation, wherein the first data contains instruction code for the processor; and

monitoring the write operation with the processor in response to the instruction code.

17. The method of claim 16 wherein monitoring the write operation comprises performing a loop read operation of a status register of the flash memory.

18. The method of claim 16 further comprises reading data from a second array bank with a second external processor while performing the write operation.

19. The method of claim 16 wherein copying first data to the buffer circuit is automatically performed by flash memory control circuitry in response to an externally provided write command.

20. The method of claim 16 wherein copying first data to the buffer circuit is performed in response to an externally provided command from the processor.

21. A method of operating a flash memory comprising:

copying first data stored in a first row of a first array bank to a buffer circuit in response to a command from an external processor coupled to the flash memory;

performing a write operation to write second data to a second row of the first array bank in response to a write command provided by the processor;

reading the first data from buffer circuit while performing the write operation in response to a read command provided by the processor, wherein the first data contains instruction code for the processor; and

monitoring a status register of the flash memory with the processor in response to the instruction code.

22. The method of claim 21 further comprises reading data from a second array bank with a second external processor while performing the write operation.

23. A method of operating a flash memory comprising:

receiving a write command with the flash memory, wherein the write command is provided by an external processor coupled to the flash memory;

automatically copying first data stored in a first row of a first array bank to a buffer circuit in response to the write command;

performing a write operation to write second data to a second row of the first array bank in response to a write command provided by the processor;

reading the first data from buffer circuit while performing the write operation in response to a read command provided by the processor, wherein the first data contains instruction code for the processor; and

monitoring a status register of the flash memory with the processor in response to the instruction code.

24. The method of claim 23 further comprises reading data from a second array bank with a second external processor while performing the write operation.

25. A method of operating a synchronous flash memory comprising:

storing instruction code in each of a plurality of array blocks of the synchronous flash memory; and

copying the instruction code from a first array block to a buffer circuit, during a write operation, so that the instruction code can be read from the buffer circuit during the write operation.

26. The method of claim 25 wherein the synchronous flash memory comprises four array blocks.

27. The method of claim 25 wherein copying the instruction code is performed in response to an externally provided write command.
